I A work of my own

Sin Línea

Sin Línea is my most ambitious project so far: an AI-powered news publication built to make its sources and editorial process visible.

Before a story is written, the system gathers sources, identifies events, researches context and checks individual claims. Writing and auditing come next. Articles that do not pass the checks can remain as drafts or move into review.

Before the ink, the evidence.

I also built the reading experience and transparency tools, including source references, corrections and reader reports. The work brought together APIs, background jobs, data and operating costs.

Sin Línea is where my earlier experiments became a complete product, with an editorial process of its own.

Next.js · FastAPI · PostgreSQL · Celery · Redis

II Notes on learning

The path to Sin Línea

Three earlier projects taught me to connect data, guide AI and build something useful from the result. Each became a starting point for the next.

PokeWiki

My first API integration used PokeAPI. It was also my first project with AI: each Pokémon has a chat where visitors can ask about it. A small idea taught me to connect external data with a conversational interface.

Visit PokeWiki

AI Resume Builder

I then integrated Claude to create résumés designed for ATS readability. The challenge was to guide the model towards a clear, useful document built around a person's experience.

Visit AI Resume Builder

One lesson at a time.

Vyra

Vyra generates dynamic job interviews within a set of instructions. It can produce technical programming questions with fresh code examples, giving each practice session variety while keeping its purpose clear.

View the Vyra presentation

Sin Línea brought those lessons together in a larger system, with a workflow and checks around the generation itself.

III Work with others

The craft of building

Alongside my own projects, working with designers and teams taught me how much a finished experience depends on careful implementation.

AP Diseño

A close collaboration between design and development. I translated the visual direction into the frontend, paying attention to composition, spacing and the details of each section. The result reflects that shared care.

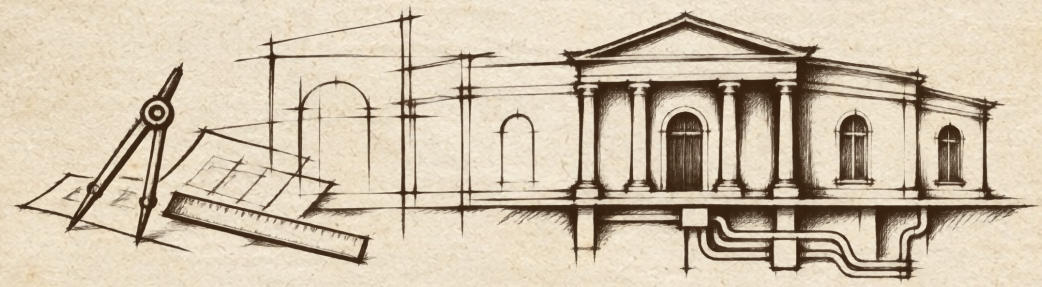

apdiseno.com.mx

Baffler

The Baffler website gave me room to work with movement as part of the design. A scroll-driven WebP sequence was one of its challenges: bringing the intended rhythm and visual quality into the implementation.

baffler.mx

Care lives in the details.

CBC Mexico

For Coldwell Banker Commercial Mexico, I developed an API and a WordPress plugin to connect property data to the new frontend. I added caching and tested the integration in staging before taking it into production.

IV A register of work

Other pages of the journey

These sites are also part of my practice. Depending on the project, I built from the ground up, renewed an existing experience, added features or worked on optimisation.

V The register continued

Further work at Baffler

Alongside AP Diseño, Baffler and CBC Mexico, I contributed to these projects within the team. The work spans new builds, redesigns and improvements across company websites and online stores.
